

Topic/Title:

How Does the Internet Work?

Keywords/Questions:

Web Servers

Web Clients

IPS

DNS

Internet Back Bone

Notes:

Web Servers: Online 24/7

Client accesses a website by connecting to the IPS

IPS then connects to DNS to look up the address of the IP that Client requested

(Phone Book)

DNS then finds the address of the IP then send back to Client

Then IPS will connect Client to the Internet Back Bone to find the Server

Then, the Server sends data back to the User

Summary:
